The Japanese version of the scale comprises 20 items with 4 options, the same as the original.
This scale consists of 4 subscales as follows: somatic and retarded activity, depressed affect, positive affect, and interpersonal relations. Higher scores indicate higher depressive symptoms.
A person with total score at and above 16 is supposed to have clinically significant depressive tendency.

2. Geriatric Depression Scale (GDS)

GDS is another depression scale adopted in our research.
 Each of 15 items has yes/no response keys. Higher score indicates higher depressive symptoms.
 Total score of 6 and higher means significant depressive tendency.
 Only participants over 60 years old performed the scale in the NILS-LSA since this scale is designed

specifically for older adults.

2) Subjective Well-being

1. Life Satisfaction Index-K (LSI-K)

The LSI-K has 9 items with 2- or 3-point response format to measure overall subjective well-being. This scale also consists of 3 subscales include: satisfaction with life as a whole, psychological stability, and evaluation of own aging.

Response to 3-point scale is dichotomized when calculating total score, so that the possible total score range is 0 to 9. Higher score indicates higher life satisfaction.

5) Stress-Related Factors

1. Stress Checklist

Fifty-eight items are picked up from some traditional checklists and scales to estimate stressful life-events and daily hassles.

Participants are asked to check off the items they confronted in recent past (between second and third examinations in the NILS-LSA).

Total number of experienced events is calculated by summing up the responses to the list.

6) ADL Scales

1. The Tokyo Metropolitan Institute of Gerontology (TMIG) Index of Competence

This scale comprises thirteen items to measure higher physical and social functions such as instrumental activities of daily living (IADL). Each item has Yes (1)/No (0) response options.
Higher score indicates higher competence level.

2. The Katz Index

This scale generates the index of basic ADLs.

The index permits ranking of individuals according to adequacy of performance in six functions (bathing, dressing, going to toilet, transferring, continence, and feeding).

Adequacy is expressed as a grade (A to G).

Level A means overall independence in the functions, and the opposite pole is level G, which means general dependence in ADL.

None of the participants in the third-wave sample were graded as level D to G.

7) Intelligence and Cognitive Function Scales

1. Wechsler Adult Intelligence Scale-Revised Short Forms (WAIS-R-SF)

This short form of WAIS-R provides cost-effective and useful estimates of intelligence particularly for older participants since their attention and motivation could diminish easily if testing becomes prolonged.

WAIS-R-SF has the following four subtests: information, similarities, picture completion, and digit symbol.

Estimated intelligence quotient (EIQ) is derived from all four subtests.

Intelligence level of individuals are ranked according to EIQ scores as low (EIQ<80), middle (80≤EIQ<120), and high (120≤EIQ).

4. Mini Mental State Examination (MMSE)

MMSE is a brief, easily-scored test of several cognitive functions.

This scale comprises questions concerning orientation in place and time, immediate and delayed recall of three words,

attention and calculation, language and praxis, and visual construction.

Cognitive impaired person might fall in the total score of 23 or less in the scale.

Only participants over 60 years old administer this scale because of the characteristic of the scale as a screening test for dementia.
