

IV. Nutritional Examinations

Three days dietary record (3DR)

Foods and nutrition intakes were assessed by the three-consecutive-day weighing dietary records. On this method, foods and dietary supplements were weighed separately with scales before or after cooked. If the subjects did not weigh foods, they asked to record food size by portion. The subjects were asked to take the photos before and after eating foods using disposable camera. The dietary records were checked and coded by nutritionists. The average intakes of food and nutrition per day were calculated according to the 5th edition Standard Tables of Foods Consumption edited by the Science and Technology Agency in Japan and others. The substituted food composition table for Japanese foods were developed by National Cancer Center for the assessment of fatty acid intakes (Sasaki et al., J Epidemiol, 9: 190-207, 1999).

Definition and categories of dietary supplement in NILS-LSA

Dietary supplement were defined as any products intended for ingestion as a supplement to the diet from unnatural food forms such as capsules, tablets, or powders, but not from functional foods or modified foods. It contains vitamins, minerals, herbs, botanicals, and other substances such as enzymes, organ tissues, metabolites, concentrates, and constituent extracts of these substances.

Dietary supplement was grouped into seven major categories according to primary nutrient contents. It contains vitamin, mineral, fat, protein, dietary fiber, others, and drug (which contains some nutrients, for example a remedy for the cold which containing vitamin C.)

Dietary supplement frequency questionnaire (DSFQ)

Dietary supplement user was defined as a subject who used one or more dietary supplement one or more times in previous one year.
